Students performed well in this exam, with many scoring over 70%. The questions people found most difficult related to the purpose of a REST API, which provides access to libraries and data, but is not able to make features more usable (this is still up to the developer), and the learnability aspect of user interfaces: maintaining consistency within and across UIs is the best way of supporting people in learning the functionality. Questions about software architecture and many aspects of the software engineering process were generally tackled well.
