People generally performed well on questions related to architecture and user interface design.

There was some confusion over integration tests: whilst these have a role in checking the application works correctly as a whole, it is actually system tests that perform this function; integration tests are for checking that messages are correctly passed between components.

Of the options provided, dynamic browser interfaces are generated in an MVC web application by processing templates containing HTML and CSS. They are not autogenerated in the controller, nor are they generated using fixtures in the view.

Before starting the implementation of a new feature when working in a software engineering team, the first thing you should always do is run the test suite, to check for existing bugs.
